Abstract: As an operating system, Linux is often used as a server operating system and a system that runs a number of network devices. Due to the importance of networking and the growing number of different network devices, including Internet of things, knowledg about configuration files and Linux networking commands becomes necessary for efficient management and monitoring of the network operation. Based on this, this paper has been created giving a look at important configuration files and network operating instructions in the Linux operating system.

Ključne reči: Linux, računarska mreža, konfiguracione datoteke, mrežne komande
