***Abstract** - The movement of water and the movement of mineral matter through the soil is a problem that needs to be solved quickly, because the increase in mineral matter in the soil increases the pollution of soil and groundwater, which will soon represent the burning problem of mankind. By model and program, which can determine the content of mineral matter in each "cm" depth of soil, we can monitor the pollution, and therefore we can control the amount of mineral matter and thus protect the land and groundwater.*

***Keywords:** Land pollution, movement through soil contamination, determination of program movement.*
